

Task 1: Sentiment Analysis of Patient Reviews Using an LLM

Using the **hospital dataset**, build a sentiment analysis system for hospital patient reviews.

Sentiment labels may include Positive, Negative, and Neutral.

Requirements:

- You must use a **Large Language Model (LLM)**.
- **In addition to sentiment classification, extract meaningful insights from the reviews.** These insights may include patterns at different levels, such as frequently occurring keywords and higher-level themes or topics.

Task 2: Building a Question & Answering (Q&A) System

Build a **Question & Answering** system for a **PDF document**.

Notes:

- There is **no requirement to build a frontend** for this task.
- The main goal is to demonstrate the use of **Retrieval-Augmented Generation (RAG)** and **language models**.
- You may choose the PDF file yourself. If you prefer, you can select an **English academic paper**.
